

# Did you know?

What you see here is "World Trade Center 7", the third skyscraper that collapsed on 9/11, at 5:20pm EDT. The above picture sequence shows its collapse in intervals of one second. It took 6.5 seconds for it to fall completely, free fall from the same height (570 ft) would take 6 seconds -- in a vacuum. So, one can certainly say that WTC7 fell without noticeable resistance. This fact, coupled with the apparent symmetry of the collapse, implies that all of the building's 83 vertical steel columns must have failed completely and simultaneously -- a behavior which, before or after this day, could only be the result of controlled demolitions. But in the case of WTC7, all governmental investigative committees, the NIST (National Institute of Standards and Technology) in particular, claim to this day that it was merely an accident, caused by falling debris from WTC1 and 2 (i.e. the Twin Towers) and ensuing fires. And yet, the official scientific explanation of this hitherto unprecedented phenomenon is still missing -- now more than 5 years later.

Of course, everyone shall arrive at personal conclusions regarding the credibility of both theses -- controlled demolition or accident -- but not without considering the following:

**TagesAnzeiger**

*"In my opinion, WTC7 was professionally demolished with great probability", says Hugo Bachmann, professor emeritus of structural analysis and construction at ETH Zürich. And Jörg Schneider, professor emeritus for structural analysis and construction at ETH Zürich as well, also interprets the few available video recordings as evidence that "WTC 7 was demolished with great probability."*

Swiss Daily „Tagesanzeiger“, Sept. 9, 2006

Below you see a partial transcript of an interview with Danny Jowenko, a Dutch demolitions specialist with more than 20 years of experience, for the Dutch TV show ZEMBLA. Jowenko had not seen or heard anything about WTC7 -- just like you, probably -- and responded entirely unprejudiced:

**DJ: That is controlled demolition.**

**Z: Sure?**

**DJ: Sure!**

(..)

**Z: But that also occurred on 9/11.**

**DJ: On the same day?**

**Z: On the same day.**

**DJ: The same day?? Are you sure?**

**Z: Yes.**

[Pause]

**DJ: Was it definitely the 11th? That is impossible!**

## First Interstate Bank, L.A.

This building, similar in design to WTC1, 2 & 7 was struck by the worst fire in the city's history in 1988. The fire raged on for 3.5 hours. A subsequent investigation found:

*"no damage to any structural members"*

Never in history has a steel-framed highrise collapsed from fires -- apart from 3 on 9/11 -- **allegedly.**
